Problem statement. For a dynamic institutionalization and construction of a market infrastructure, the Ukrainian economy needs to introduce the appropriate modern mechanisms. In this connection, the problem of scientific substantiation of innovative technologies and adequate activities of public administration comes to the forefront.

Recent research and publications analysis. Research done in public administration by the Ukrainian economic development experts has a certain history and considerable achievements. This concerns the scientific works by O. Amosov, V. Babaiev, M. Dolishnii, V. Geiets, A. Hrytsenko, M. Latynin, E. Libanova, T. Lozynska, A. Merzliak, I. Mykhasiuk, N. Oliinyk, V. Sobolev and many other scholars. It allows using effectively the appropriate conceptual provisions and specific recommendations of the Ukrainian scientists for working out the quadrants of an effective development of the national economy.

The paper objective is analysis of the current Ukrainian economy’s development and putting forward proposals as to innovative means of making it more dynamic.

The paper main body. In all the advanced economic systems, the state is an active subject of economic processes. State regulation of the economy in the market conditions includes a system of measures of regulatory, administrative and organizational, financial and economic character (public administration mechanisms), which are implemented by state institutions with the aim of the
socio-economic system’s stabilization and adaptation to the environment that is changing under the influence of the scientific and technological progress and globalization.

The term of a ‘quadrant’ refers to any of the four parts of the square area, which are formed by two orthogonal lines (coordinate axes). The author proposes for analysis the quadrants of the national economy’s effective development that make it possible to take into account the sequence of its changes, its assets (funds), and time, namely:

I. Disturbance of the balance of the economy
II. Building-up investments
III. Mobilization of own innovation-information space and resource potential
IV. Sustainable development in a globalized world

Conclusions of the research. Further specification and content of the quadrants of the Ukrainian economy’s effective development presupposes a due regard of new processes in the world economy, and namely: (1) a trend towards a reduced demand in the raw material market, since specialization and cooperation of knowledge-intense product manufacture, high technologies, new kinds of production materials allow getting over a relative scarcity of natural resources; (2) an intensive development of the international scientific and technological know-how market and trade in financial services.
