An extended abstract of the paper on the subject of:

METHODOLOGICAL APPROACHES
TO THE ORGANIZATION AND ESTIMATION OF EFFECTIVENESS
OF STATE REGULATION OF GRAIN MARKET DEVELOPMENT

Problem statement. The current trends of the grain market development, an increased influence of the external factors on its functioning and development, structural reconstruction of the branch, and other specific features of the current stage of the agribusiness industry require an active application of the modern research methods, qualitatively new approaches to forming and functioning of the mechanism for state regulation of the grain market development, evaluation of its development and administrative performance.

Recent research and publications analysis. The problem issues and directions of grain business development in Ukraine have been elucidated in the numerous works by such domestic scholars as V. Boiko, V. Burnukyn, M. Kovalenko, M. Latynin, K. Lebedev, P. Sabluk and other researchers. Among the scientists, there is no generally accepted opinion as for approaches to forming, functioning, and evaluation of the mechanism for the state regulation of grain market development; which necessitates a further study of this issue.

The paper objective is to consider methodological approaches to forming and functioning of the mechanism for the state regulation of grain market development, evaluation of the efficiency of the grain market regulation in Ukraine under the current conditions.

The paper main body. The methodology of researching an organization and economic mechanism for public administration of the grain market under the current conditions has to cover the research methods that are based on a dialectic and
hierarchic approach to the grain market as a component of the economic system, which is characterized by mobility, development, and contradictions.

Substantiation of the methods for evaluation of the said mechanism should be performed in the following sequence: searching for evaluation methods; establishing evaluation principles; designing an evaluation algorithm.

Considering a multibranch structure of the market, comprising both agricultural, and processing, production, transport enterprises, market infrastructure agencies etc., it is expedient to apply a differential approach to evaluation of administrative performance, since every branch of the grain market has its own specificity depending on the kind of its activity.

**Conclusions of the research.** The conducted research shows that the state mechanisms of grain market regulation that are used today are often inefficient, insufficient, or non-applicable for both objective and subjective reasons.

Therefore, to achieve the set goal of grain market development, it is necessary to resolve a series of tasks, which becomes increasingly difficult due to the existing problems. In addition, most of the present problems cannot be solved by means of the market mechanism, which calls for an essential support for the branch on behalf of the state and introduction of an efficient state regulation mechanism.
