An extended abstract of a paper on the subject of:

«METHODS OF FORMING MAIN APPROACHES PRINCIPLES
OF STATE REGULATION DEMOGRAPHIC DEVELOPMENT»

Methodological approaches to forming the basic principles of state regulation of demographic development, which is based on the system of methods - tools necessary for the task, are studied in the article.

Modern methodical approaches to regulation of demographic processes require a deep analysis of existing demographic policy and improvement of the basis of an adequate mechanism of state regulation of demographic development.

Problem setting. There is application of principles of the system approach and the general theory of systems in study of laws and patterns of reproduction of the population among methodological foundations of a comprehensive study of demographic phenomena and processes. Problems of formation of basic principles of state regulation of demographic development and development of measures regarding specific demographic regulation are caused by demographic trends characterized by an increase in urban population, a large concentration of production and infrastructure in settlements.

Recent research and publications analysis. Formation of state regulation of demographic processes and methods of state regulation of demographic processes were studied by such scientists as D. Bohynia, A. Hrishnova, V. Dzhaman, I. Drahan, E. Libanova, I. Kurylo, O. Makarova, Yu. Muromtseva, V. Pyrozhkov, V. Steshenko, S. Stetsenko and others.

Paper objective. Justification of methodical approach to formation of principles of state regulation of demographic development requires more detailed consideration of the content of such regulation, including functions of the state,
subjects and objects, methods of influence. In order to determine the place of state regulation of demographic development in social and economic development of the country, the procedure for formation of methods of state regulation of demographic processes is of a particular interest is the study. However, the methodology of state regulation of demographic processes is still not justified and ensures particular relevance for the research.

**Paper main body.** In modern theory there are several approaches to determining principles of state regulation of demographic development. In particular, the common position is that, where a special place of formation and implementation of population policy includes protection of the family. Based on this, methodology of state regulation of demographic processes should be based on the following basic principles.

Synthesis and analysis of considered methodological approaches makes it possible to substantiate allegations, according to which the basis of the revised methodology for state regulation of demographic development should be principles of progressivity, relevance, differentiation, integrity, organization, communicativeness.

Thus, these principles should be the basis for formation of mechanisms of state regulation of demographic development.

Creation of mechanisms of state regulation of demographic development and a favourable environment in the society will improve the demographic situation in Ukraine. That is, demographic development is to become a major policy priorities.

**Conclusions of the research.** The result of the above methods is to identify strengths and weaknesses of implications on reproduction of the population for further approval of justified decisions about improving the mechanism of state regulation of demographic development.
